

# Wireless Notification without Packet Decoding

International Conference on Autonomic Computing (USENIX : ICAC ), June 2013

Kevin Chen and H.T. Kung

May 3, 2013

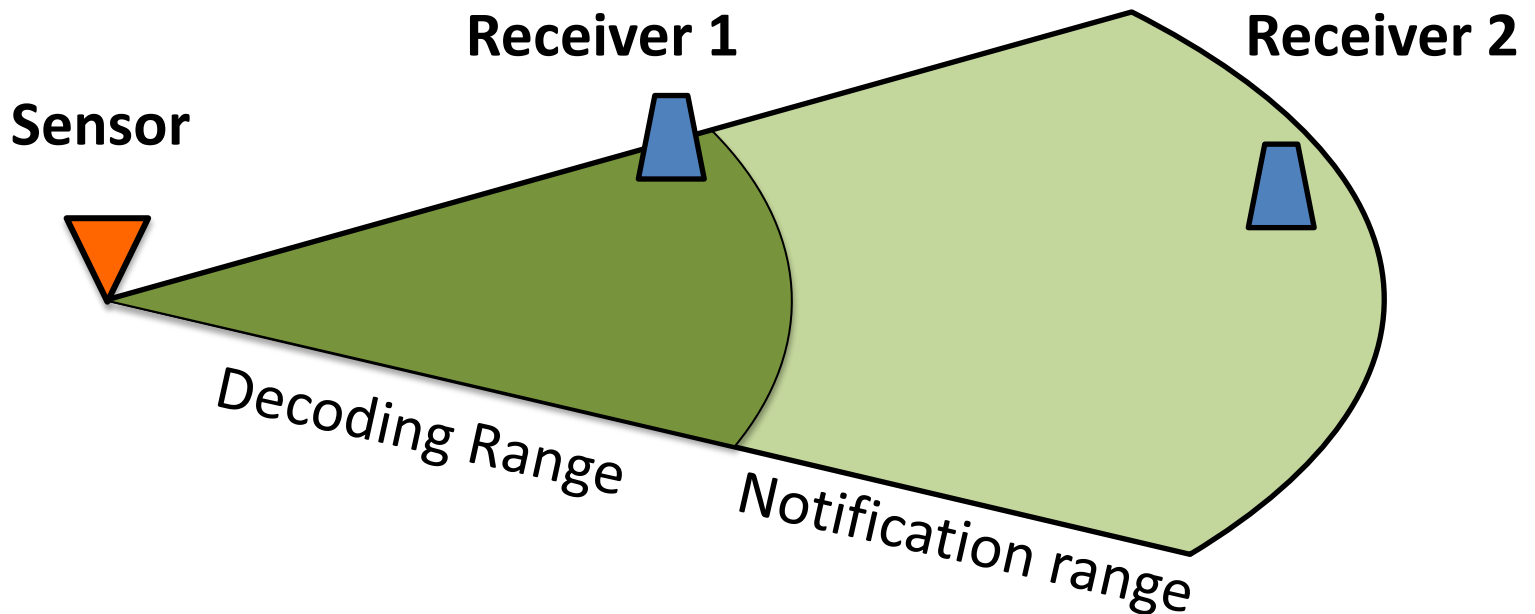

## Packet Decoding

No information is known about the packet at decoding time.

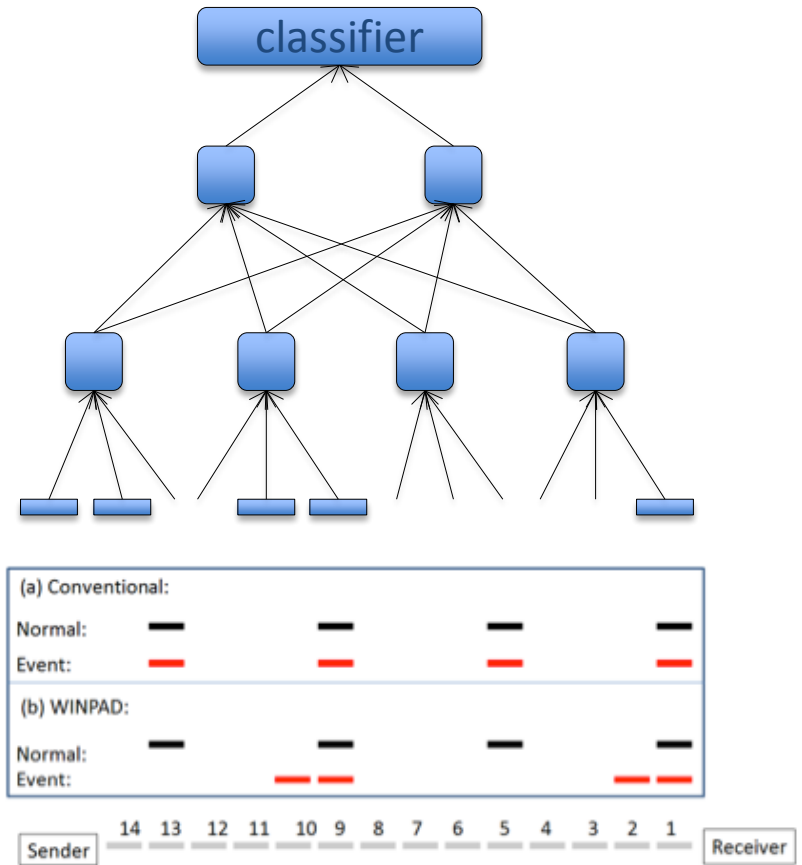

## Speculative Packet Reception

1. Predict arriving packets and their arrival pattern.
2. Verify prediction.

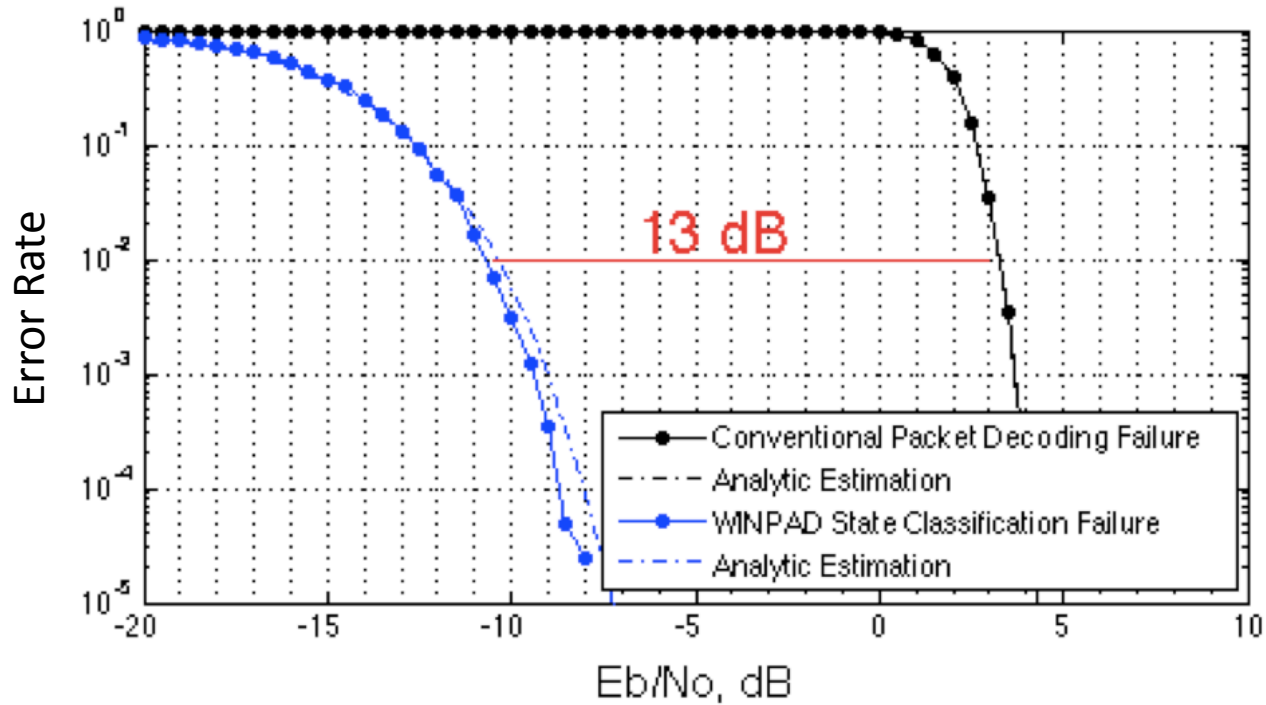

# Speculative Packet Reception

1. Predict arriving packets and their arrival pattern.
2. Verify prediction.  
(maximum likelihood)

# Performance Gain

13 dB gain translates to 4x range in free space.

It is possible to build a protocol on top of existing protocols for low-rate transmission (notification). Our approach can increase the effective range for low energy sensors.

# Conclusion

We have proposed a novel approach for low-power sensors to communicate at lower SNR compared to conventional approach.
